Overview

Public Hospital Cost Benchmarks

July 2004

Overview

In February 2002, as a result of the Aligning Services and Priorities (ASAP) Project, the Cabinet Budget Review Committee (CBRC) recommended the introduction and application of formal performance benchmarks for Queensland Public Hospitals. The purpose of these benchmarks is to specifically identify areas where performance could be improved and initiate appropriate management action.

The benchmark costs contained in this version of the *Public Hospital Cost Benchmarks* (2004/05) replace the cost benchmarks in the previous 2002/2003 version of the *Hospital Benchmarking Prices Model (HBPM)*.

Objectives

The cost benchmarks contained in this document reflect projected recurrent costs for Queensland public hospitals based on actual 2002/2003 costs. These benchmarks are intended to be used in conjunction with the Clinical Benchmarking System as tools by Districts and Zonal Management Units to facilitate benchmarking and to identify specific areas where performance could be improved. The use of these benchmarks for other purposes, such as contracting with the Commonwealth or private providers, needs to consider additional issues such as depreciation, return on investment and corporate costs.

Scope

The scope of this document includes acute public hospitals with recurrent budgets over \$6M per annum. Hospitals outside of this scope are primarily rural and remote and have largely fixed costs and limited opportunity for efficiency improvements, but are referred to as Group X for convenience. The cost benchmarks for the Emergency Department component apply only to the specific hospitals listed in Section 1.5.

Components

This document contains cost benchmarks for the following components:

- Acute Inpatients;
- Sub and Non-Acute Patients (General Wards);
- Sub and Non-Acute Patients (Designated Units);
- Designated Psychiatric Units;
- Emergency Departments; and
- Renal Dialysis.

With the current emphasis being in relation to inpatient cost benchmarks, the Ambulatory, Other Specified Activity and Measured Quality components from the previous model have been removed. The 2003-2008 Australian Health Care Agreement (AHCA) commits Queensland to adopting a Non-Admitted Patient National Minimum Data Set, but at the time of writing the outpatient clinic classification has not been agreed. Once this is agreed and costing data becomes available, the Ambulatory benchmarks will be re-introduced.

As the primary focus of these benchmarks is the individual component level rather than the overall hospital, there is no longer a requirement to develop casemix budgets.

Peer Groups

The hospital peer groups from the previous model were re-validated against more current data and have remained unchanged for the inpatient components. The hospitals in scope have a recurrent budget over \$6M per annum. Group X hospitals, ie. those with recurrent budgets less than \$6m per annum, are outside the scope of this document.

The Emergency Department component contains a new peer group listing (see Section 1.5). The peer groups have been modified based on consultation with the Clinical Services Analysis Team and Surgical Access Service.

It is important to note that the hospital peer groups were developed for comparability of overall inpatient costs between hospitals and that metrics such as cost per weighted separation are most applicable within relevant peer groups. However, comparisons of specific services that are provided from a wide range of hospitals (for example, orthopaedics and general obstetrics) can and should cross the *Public Hospital Cost Benchmarks* peer groups using tools such as the *Clinical Services Capability Framework* developed by the Clinical Services Analysis Team.

Benchmark Cost Setting

The cost benchmarks in this document have been set using the results from Round 7 of the National Hospital Cost Data Collection (NHCDC), which covered the 2002/2003 financial year. The actual cost was adjusted upwards for projected CPI and Enterprise Bargaining wage increases. These projected costs were then deflated to make provision for the outlier policy. The resulting cost benchmarks are therefore appropriate for 2004/2005. Should these benchmarks be used beyond 2004/2005, they should be indexed appropriately and, where possible, adjusted for changes in clinical practice, medical technology and pharmacology since 2002/2003.

As with the previous *Hospital Benchmarking Prices Model*, the base price to be used for the cost benchmarks within this document is \$2,500. This is close (but not equal) to the actual average cost per case and has been set arbitrarily to simplify calculations.

DRG Classification

The former *Hospital Benchmarking Prices Model* used Version 4.2 AR-DRGs. Version 5.0 AR-DRGs were released by the Commonwealth in 2002 following extensive consultation. Queensland Health has been reporting in Version 5.0 AR-DRGs to the Commonwealth since July 2003 and they have now been adopted as the inpatient classification for benchmarking. Various corporate information systems have already been enhanced to provide Version 5.0 AR-DRG data.

Version 5.0 is a significant change from Version 4.2, with 75 DRGs being discontinued and 79 added. Whilst approximately 84% of cases group to the same DRG in both versions, it is not advisable to compare Version 4.2 DRG cost weights from the *Hospital Benchmarking Prices Model* with the Version 5.0 *Public Hospital Cost Benchmarks*.

The following table details the AR-DRG version and ICD10 Edition used in different phases of recent Models.

Table 1 - Recent AR-DRG Versions and ICD-10 Editions

Model	Year/s in effect	ICD-10-AM Edition	AR-DRG Version
Hospital Funding Model (Phase 6)	1999/2000	ICD-10 Ed 1	AR-DRG 4.1
Hospital Funding Model (Phase 7)	2000/2001 2001/2002	ICD-10 Ed 2	AR-DRG 4.1
Hospital Benchmarking Prices Model (Phase 8)	2002/2003 2003/2004	ICD-10 Ed 3	AR-DRG 4.2
Hospital Cost Benchmarks (Phase 9)	2004/2005	ICD-10 Ed 4	AR-DRG 5.0

DRG Benchmark Cost Modifiers

The former *Hospital Benchmarking Prices Model* 2002/03 used two modifiers for DRG cost benchmarks – public/private status and length of stay. The public/private status modifier is unchanged. The length of stay modifier is still used but the trim points are now calculated using percentiles, rather than the previous I3H3 methodology (ie a low trim point at one third of the average length of stay and a high trim point at three times the average length of stay). See Section 1.1.4 for further information.

Technical Paper

Public Hospital Cost Benchmarks
July 2004

Technical Paper

The *Public Hospital Cost Benchmarks 2004/2005* consists of the following components:

- Acute Inpatients
- Sub and Non-Acute Inpatients (General Wards)
- Sub and Non-Acute Inpatients (Designated Units)
- Designated Psychiatric Units
- Emergency Departments
- Renal Dialysis

1. Variable Components

1.1 Acute Inpatient Benchmarks

This component includes all acute inpatient episodes, with the exception of acute patients treated in Designated Psychiatric Units. Episodes will be coded using 4th Edition ICD-10-AM and grouped to Version 5.0 of the Australian Refined-Diagnosis Related Group (AR-DRG) classification system. A statistical analysis of the differences between V4.2 and V5.0 AR-DRGs was undertaken by the Costing & Analysis Team. This showed an improvement in homogeneity between the versions.

The cost benchmark for each AR-DRG will depend on:

- The hospital group (see section 1.1.1)
- The Average Length Of Stay (ALOS) for each AR-DRG (see section 1.1.4)
- The public or private status of the patient (see section 1.1.5)

1.1.1 Hospital Groups

Information from Round 7 of the NHCCDC was used to re-validate the hospital peer groupings.

The peer groups for the Acute Inpatient component are as follows:

Group A

Gold Coast Hospital; Mater Mothers' Hospital; Princess Alexandra Hospital; Royal Brisbane and Women's Hospital; The Prince Charles Hospital; The Townsville Hospital.

Group B

Bundaberg Hospital; Caboolture Hospital; Cairns Base Hospital; Gladstone Hospital; Hervey Bay Hospital; Ipswich Hospital; Logan Hospital; Mackay Base Hospital; Maryborough Hospital; Mater Adult Hospital; Mount Isa Hospital; Nambour Hospital; Queen Elizabeth II Jubilee Hospital; Redcliffe Hospital; Redland Hospital; Rockhampton Base Hospital; Toowoomba Hospital.

Group P

Mater Children's Hospital; Royal Children's Hospital.

Group I

Atherton Hospital; Ayr Hospital; Beaudesert Hospital; Caloundra Hospital; Dalby Hospital; Gympie Hospital; Innisfail Hospital; Kingaroy Hospital; Mareeba District Hospital; Roma Hospital; Thursday Island Hospital; Warwick Hospital.

Group X

Hospitals with budgets of less than approximately \$6 million per annum are outside the scope of this document.

1.1.2 Cost Weights

The relevant cost weights and other parameters for each AR-DRG are included in the *2004/2005 Public Hospital Cost Benchmarks Technical Supplement*. These details are provided separately for each hospital group outlined above.

The weights are based on Round 7 (2002/2003) NHCDC results. The NHCDC is an annual voluntary collection undertaken in partnership with the Australian Government and other States. It provides nationally accepted standards that allow meaningful comparisons between Queensland and other States. For Round 7, 35 Queensland public hospitals (accounting for approximately 87% of statewide separations) participated in the NHCDC. The majority of these hospitals were Clinical Benchmarking sites and the required data was therefore extracted directly from the Clinical Benchmarking System. After extensive validation, summarised data was submitted to the Australian Government which also applied rigorous quality assurance checks.

The participating hospitals which were not Clinical Benchmarking sites were cost-modelled using the COMBO software provided by the Australian Government. This software was also used to produce a consolidated statewide database that included summarised data from the Clinical Benchmarking sites.

The consolidated statewide COMBO database was then used to validate the allocation of hospitals to peer groups, re-calibrate the components and calculate the average DRG costs within each peer group. Since not all DRGs are represented within each peer group (for example, A05Z – Heart Transplant is only carried out in one Group A hospital), benchmark costs for these DRGs in other peer groups were derived by scaling the State average for that DRG by the overall peer group average. This process was also used to remove anomalies due to small case numbers and other factors.

Under normal circumstances, the cost of individual DRGs within the same base DRG would follow the severity hierarchy; ie the cost for E69A (Bronchitis and Asthma, Age > 49 with CC) would be higher than that for E69B (Bronchitis and Asthma, Age > 49 or with CC), which would be higher than E69C (Bronchitis and Asthma, Age < 50 without CC). Where this was not the case within a given peer group, this was scaled to the state average.

This practice impacted the Group P hospitals more so than other peer groups and has been discontinued for Group P. The Group P cost benchmark for E69B (\$5,218) is actually higher than the cost benchmark for E69A (\$3,547). However, in all the other peer groups, the E69A cost benchmark is higher than the E69B cost benchmark.

The DRG cost weights were then scaled for projected CPI and Enterprise Bargaining increases and adjusted for outliers (that is, the inlier benchmark was set slightly lower than the average cost to allow for the higher than average benchmarks for long stay and extra long stay outliers).

1.1.3 Base Rate Per Weighted Separation

The base rate per weighted separation for 2004/05 has been set at \$2,500. This remains unchanged from the previous *Hospital Benchmarking Prices Model*. As this is close (but not equal) to the actual average cost per separation, a cost weight of one means that the DRG cost benchmark is close to the State average.

1.1.4 Length of Stay

This section describes Length Of Stay (LOS) outliers and outlines how to calculate the cost benchmark for outlier episodes.

The AIOS for each DRG was calculated from 2002/2003 data grouped to AR-DRG Version 5.0. This information was used to calculate trim points for each DRG and hence determine whether episodes fall into the inlier or outlier category. The DRG cost benchmark depends on how long the patient stays in hospital in relation to the relevant trim points.

The method used for calculating the trim points has changed from previous models. The I3H3 method used with previous models had trim points based on one third and three times the AIOS. This method relied on

assumptions about the normality of the LOS distribution. These assumptions are no longer valid, with the result that continuation of the model would not be equitable for some DRGs. The new methodology based on percentiles is more sound and does not rely on the statistical normality of LOS data. Hence, the trim points calculated for each AR-DRG have been modified by using this more equitable methodology.

The graphs below show a typical distribution for LOS. A normal distribution is superimposed. As can be seen, with no trimming, the distribution is not symmetrical and is skewed to the right (ie the average LOS is to the right of the median LOS). In order to approximate a normal distribution, extreme values must be trimmed aggressively. With almost 7% of the extreme LOS values discarded, the distribution is only slightly skewed. In the example, the trimming changed the average cost by over 7%. For a DRG with high volumes, this can have a major effect.

LOS Distribution for 001B Caesarean Delivery + SCC

The issue with trimming the data is to determine when the trimming is sufficient – striking a balance between an accurate average cost or LOS and discarding data on the most expensive patients. By utilising percentiles, there is no need to discard any data and the trim points are not as easily distorted by extreme values.

The use of percentiles allows the nomination of values that represent a proportion of the data. For an individual DRG, the 50th percentile of the LOS is the mid point of the LOS (or median LOS). Half the patients (50%) would have stayed less than the 50th percentile, and half for longer. The advantage of using percentiles is that they are not as affected by underlying problems with the distribution, including exceptions or any skewing of the LOS data. It should be noted however that for some DRGs, the skew level is so great that even percentiles are affected.

- **Low Trim Point (LT)**
Calculated as the 10th percentile. For an individual DRG, at least 90% of the patients would have a LOS greater than or equal to the 10th percentile. However, the distribution for most DRGs is so skewed that this is just one day. For these DRGs, there is no LT point set and there will be no short stay outliers. There are 505 (out of 665) DRGs where the LT point is one day, and less than one half of one percent of all cases are classified as short stay outliers.
- **High Trim Point (HT)**
Calculated as the 95th percentile. For an individual DRG, it means that 95% of the patients will have a LOS less than or equal to the 95th percentile.
- **Extra High Trim Point (EHT)**
Calculated as the 98th percentile. This means that 98% of the patients will have a LOS less than or equal to the 98th percentile.

The following diagram shows the proportion of inliers and outliers using these trim points

Proportion of Outliers vs Inliers

The following diagram demonstrated how these trim points differ from the L3H3 method for the G01B DRG (Rectal Resection - CCC).

Trim points for the Percentile and L3H3 methodologies

G01B - Rectal Resection - CCC

Under the L3H3 methodology, the low trim point would be three days, the high trim point would be 30 days and the extra high trim point would be 50 days, although the maximum LOS is only 37 days. Under the percentile methodology, the low trim point would be 6 days, the high trim point would be 17 days, and the extra high trim point 23 days. This is much more realistic and clinically meaningful.

The following diagram highlights the sections defined by the three trim points and the effect that they have on the cost benchmark:

Individual trim points are not calculated for each peer group. State figures were used, so each peer group will have slightly different proportions of patients between the trim points. With the exception of just 3 DRGs, at least 85% of all patients will be classified as inliers for a DRG. In those DRGs with no Low Trim point set, then 95% or more of patients will be classified as Inliers.

Short Stay Outliers

A patient is known as a Short Stay Outlier if their LOS falls below the Low Trim Point. For Short Stay Outliers, the Cost Benchmark will escalate on a per diem rate based on a proportion of the Inlier Cost Benchmark. This is similar to the L3H3 methodology.

Inliers

A patient is known as an Inlier if their LOS falls between the Low Trim Point and the High Trim Point (inclusive). The Inlier Cost Benchmark remains constant between the Low and High Trim points.

Long Stay Outliers

A patient is known as a Long Stay Outlier if their LOS is above the High Trim Point and less than or equal to the Extra High Trim Point. Under the L3H3 model, the benchmark cost for patients that reached the Extra High Trim Point was roughly double the inlier payment. The data now available from the Clinical Benchmarking System does not support this and the limit of double the Inlier Cost Benchmark has been removed. It was apparent that many of the costs (such as prosthetics) that were incurred during the inlier period were one-off costs that should not have been included in the long stay per diem payments.

The Cost Benchmark will escalate on a per diem rate based on the daily cost of patient care for this type of DRG within the peer group, capped at the inlier payment. To calculate the daily cost, the NHCD cost buckets that related to the ongoing stay were included. The included cost buckets were:

- Ward Medical
- Ward Nursing
- Non-Clinical Salaries
- Hotel
- Allied Health
- Pharmacy
- Ward Supplies and Overheads
- OnCosts

The cost buckets excluded were those that were related to the initial treatment (ie. one off costs) and were not related to an ongoing stay. The excluded cost buckets were:

- Pathology
- Imaging
- Critical Care
- Operating Rooms
- Specialist Procedure Suites
- Prostheses

Daily rates were developed within each peer group for the DRG types of the Surgical, Medical, and Other. These represent the broadest level of the DRG classification and have a large number of cases, making the cost estimates quite robust.

Extra Long Stay Outliers

A patient is known as an Extra Long Stay Outlier if they remain in hospital for any number of days above the Extra High Irim Point. The Extra Long Stay Outlier benchmark is based on the minimum cost per day. This has been increased from \$150 per day to a more realistic, flat rate of \$250 per day for Group A, B and P hospitals, and \$200 per day for Group I hospitals (reflecting their lower infrastructure costs).

Previous Model Comparison

The change to the new methodology removes some of the inequities of the previous model. The following are some examples from Group A comparing the I3H3 benchmarking model with the new percentile-based benchmarking model

There is a steep rise using the I3H3 method for Long Stay Outliers caused by a very expensive prosthetic and the increment to double the inlier benchmark. If the patient stays just a few more days, they double their cost benchmark. In contrast, the percentile model includes the prosthetic cost in the base and then increments at a more reasonable rate.

Go1B - Rectal Resection - CCC

For this DRG, the length of the Inlier component is unreasonably long using the L3H3 method due to the skewed distribution distorting the Low and High Trim Points. The percentile model responds more rapidly with approximately half the time as an inlier.

E01A - Major Chest Procedure + CCC

This is a typical DRG, showing that there are similarities with the Low Trim Point between the methods, however the percentile method has a lower High Trim point. The artificial limit of double the Inlier Cost Benchmark is also removed. This demonstrates the greater responsiveness of the new method.

E61A - Pulmonary Embolism + CCCC

With the percentile method, some DRGs that are particularly skewed will not have a Low Trim Point. This is a typical example. The percentile method commences with the Inlier Cost Benchmark and reaches the High and Extra High Trim Points sooner than the L3H3 method. The improved daily rate for Extra Long Stay Outliers is highlighted here.

Inlier Cost Benchmark

The cost benchmark for inlier patients is calculated by multiplying the appropriate AR-DRG cost weight by the base rate per weighted separation.

The formula for this calculation is as follows:

$$\text{Cost benchmark} = \text{AR-DRG cost weight} \times \text{Base Rate } (\$2,500)$$

For example, if a particular AR-DRG for peer group A with a weight of 3.45 has an ALOS of 11 days, the Low Trim Point will be the 10th percentile for that DRG, ie 4 days. The High Trim Point will be the 95th percentile of 23 days for this DRG. If a patient who falls into this AR-DRG is discharged after fifteen days, they would be classified as an inlier and the cost benchmark would be \$8,625.

$$\text{Cost benchmark} = 3.45 \times \$2,500$$

$$= \$8,625$$

Short Stay Outlier Cost Benchmark

The cost benchmark for Short Stay Outlier patients is as a pro-rata proportion of the AR-DRG Inlier Cost Benchmark.

The formula for this calculation is as follows:

$$\text{Cost benchmark} = \frac{\text{Actual Length of Stay}}{\text{Low Trim Point}} \times \text{AR-DRG Inlier Cost Benchmark}$$

For example, a particular AR-DRG has an inlier cost benchmark of \$8,625, an ALOS of 11 days, and a Low Trim Point of 4 days (that is, the 10th percentile). If a patient who falls into this AR-DRG is discharged after two days, the cost benchmark would be \$4,312.50

$$\begin{aligned}\text{Cost benchmark} &= 2/4 \times \$8,625 \\ &= \$4,312.50\end{aligned}$$

Long Stay Outlier Cost Benchmark

The cost benchmark for Long Stay Outlier patients includes both an inlier cost benchmark and a long stay outlier per diem rate. The inlier cost benchmark covers the patient stay up until the High Trim Point and the long stay outlier per diem rate compensates for the patient days between the High and Extra High Trim points.

The long stay outlier cost benchmark is a per diem rate based on the daily cost of patient care for this DRG type within the peer group. The payment will therefore escalate at the daily cost of maintaining a patient in hospital for that type of DRG. Unlike the previous model there is no predetermined upper limit of double the inlier cost benchmark, but the per diem rate is capped at the inlier payment. There are relatively few DRGs that are affected by this cap and they are predominantly sameday DRGs.

The formula for this calculation is as follows:

$$\begin{aligned}\text{Cost benchmark} &= \text{Inlier Cost Benchmark} \\ &+ (\text{Actual Length of Stay} - \text{High Trim Point}) \times \text{Long Stay Per Day Rate}\end{aligned}$$

Using the above example of an AR-DRG with an inlier cost benchmark of \$8,625 and an ALOS of 11 days; the High Trim Point will be 23 days (that is, the 95th percentile) and the Extra High Trim Point will be 26 days (that is, 98th percentile). If a patient is discharged after 25 days the long stay outlier cost benchmark will be \$9,729.

$$\begin{aligned}\text{Cost benchmark} &= \$8,625 \text{ (Inlier cost benchmark)} \\ &+ (25 - 23) \times \$552.21 \text{ (Long Stay Per Day Rate for Medical DRGs)} \\ &= \$8,625 + (2 \times \$552) \\ &= \$9,729\end{aligned}$$

Extra Long Stay Outlier Cost Benchmark

The cost benchmark for an Extra Long Stay Outlier patient will consist of the inlier cost benchmark for the days up until the High Trim Point, a long stay per diem rate for the days between the High and Extra High Trim Points, and a per diem rate for the days above the Extra High Trim Point.

The formula for this calculation is as follows:

$$\begin{aligned}\text{Cost benchmark} &= \text{Inlier cost benchmark} \\ &+ (\text{Extra High Trim Point} - \text{High Trim Point}) \times \text{Long Stay Per Day Rate} \\ &+ (\text{Actual length of stay} - \text{Extra High Trim Point}) \times \text{Extra Long Stay Per Day Rate}\end{aligned}$$

Again using the above example, if a patient is discharged after 36 days from a Group A, B or P hospital, the cost benchmark will be \$12,782.

$$\begin{aligned}
 \text{Cost benchmark} &= \$8,625 + (26 - 23) \times \$552.21 + (36 - 26) \times \$250 \\
 &= \$8,625 + (3 \times \$552.21) + (10 \times \$250) \\
 &= \$12,782
 \end{aligned}$$

1.1.5 Public and Non-Public Acute Inpatients

Public and non-public weights have been developed for each AR-DRG. The following NHCD cost components have been excluded from the non-public weights:

- Ward Medical costs (note that this does not exclude medical costs incurred in theatre or critical care);
- Prosthetic costs;
- Pathology costs; and
- Diagnostic Imaging costs.

1.1.6 "Zero Weight" DRGs

Cost weights for certain AR-DRGs have been set to zero to ensure hospitals do not benefit from poor or inaccurate coding practices. The following DRGs will have a cost weight of zero:

- 903Z Prostatic OR Procedure unrelated to principal diagnosis
- 960Z Ungroupable
- 961Z Unacceptable principal diagnosis
- 963Z Neonatal diagnosis not consistent with age/weight

The following DRGs continue to have cost weights set to zero in line with alternative arrangements:

- Z60A Rehabilitation W Catastrophic or Severe CC
- Z60B Rehabilitation W/O Catastrophic or Severe CC
- Z60C Rehabilitation, Sameday

1.2 Sub and Non-Acute Inpatient (SNAP) Benchmarks

The bedday cost benchmark for SNAP activity that occurs in designated units will be based on the SNAP class type and class number. For general wards, the bedday cost benchmark is based on the National Health Data Dictionary care types.

1.2.1 Sub and Non-Acute Inpatients treated in Designated Units

In Designated SNAP Units, sub and non-acute admitted patient activity is reported on the basis of the Australian National - Sub and Non-Acute Patient Classification System Version 1 (AN-SNAP V1). Cost benchmarks have been developed for each of the seventy-one (71) class types in the AN-SNAP V1.

Hospitals will be required to collect and report Activities of Daily Living (ADI) scores and Palliative Care Phases on admission. Where an ADI score has not been provided, an additional class per SNAP class type has been included with a cost benchmark equal to the general ward benchmark.

At the time of writing, the Clinical Services Analysis Team (Analysis & Evaluation Unit) are producing Clinical Services Capability Frameworks for Palliative Care Services and Rehabilitation Services. It is envisaged that as these documents become operational, the service levels specified in the frameworks will be reflected in the Designated SNAP Unit component of this document. For example, it is possible that the Designated SNAP units will be defined as those with a *Clinical Services Capability Framework* level equal to x and above, with x being the appropriate service level.

In the interim, the following criteria are to be applied in determining whether a facility has a Designated SNAP Unit. A Designated SNAP Unit must:

- Be either a free standing unit or a designated separate unit in a general hospital. A designated unit must be allocated a separate HBCIS ward code.
- Be expected to maintain protocols and regularly monitor and audit quality.
- Have sufficient capacity and throughput to ensure specialised staff skills are maintained.
- Classify patients according to the SNAP care types outlined in Section 12 of the Queensland Hospital Admitted Patient Data Collection (QHAPDC) Manual.

Hospitals must liaise with the Costing & Analysis Team in relation to amendments or additions to designated SNAP units.

Refer to Appendix A for the 2004/2005 bedday cost benchmarks for sub and non-acute patients treated in designated units.

1.2.2 Sub and Non-Acute Inpatients treated in General Wards

Many hospitals without Designated SNAP Units will treat sub and non-acute patients in general wards (not designated as SNAP or Psychiatric). Consequently, bed day cost benchmarks have been developed for all patients admitted to a general ward as one of the following care types:

- Geriatric Evaluation and Management (09);
- Psychogeriatric (10);
- Maintenance (11);
- Rehabilitation (designated program (22) or clinical intent (23));
- Palliative (designated program (32) or clinical intent (33)).

The bedday cost benchmarks for general ward patients are as follows:

Table 2 - SNAP General Ward Bedday Cost Benchmarks

Care Type	Care Type Description	Cost benchmark (\$) per Bedday
9	Geriatric Evaluation and Management	500
10	Psychogeriatric	500
11	Maintenance	425
22, 23	Rehabilitation (overnight)	525
22, 23	Rehabilitation (sameday)	150
32, 33	Palliative	525

Note: When determining occupied beddays for sub and non-acute inpatients treated in general wards, lengths of stay for individual patients remaining in hospital for longer than 365 days will be truncated to 365 days.

1.3 Designated Psychiatric Unit Benchmarks

The groupings and cost benchmarks for the Designated Psychiatric Unit component have been revised in conjunction with the Mental Health Unit. The Designated Psychiatric unit categories have been expanded to include a group for Secure Unit patients (including medium and high secure). It was recognised that there are certain designated psychiatric unit categories that would not normally treat patients as sameday patients. As a result, there are no sameday cost benchmarks for the Adult Extended and Secure Unit categories.

The bedday cost benchmarks have been developed for days accrued in designated psychiatric units. Patients who spend only part of their inpatient stay in a designated psychiatric ward will be allocated the appropriate number of psychiatric beddays and an AR-DRG or SNAP type depending on whether the remaining days were in a general ward or Designated SNAP Unit. Patients receiving psychiatric care in general wards will receive an AR-DRG payment only.

The following criteria should be applied to determine whether a facility has a Designated Psychiatric Unit:

- There is a dedicated ward or unit (can be stand alone) that receives identified funding for specialised mental health care; and
- The unit is devoted to the provision of specialised mental health services.

The Costing & Analysis Team will liaise with the Mental Health Unit regarding eligible units.

Table 3 - Designated Psychiatric Unit Cost Benchmarks

Designated Psychiatric Unit Type	Cost Benchmark per bedday (\$)	Cost Benchmark same day (\$)
Adult Acute	652	418
Acute Children's and Young People's	1057	677
Adult Extended Unit: Acquired Brain Injury and Psychogeriatric	365	N/A
Adult Extended Unit: Rehab and Dual Diagnosis	410	N/A
Secure Unit	782	N/A

Note: previous versions of the Hospital Funding Model incorporated Optimal Staffing Profile figures. The cost benchmarks in the current model are calculated differently and are based on National Hospital Cost Data Collection (NHCDC) data from the Clinical Benchmarking System.

The Queensland Health Mental Health Unit is continuing to work on the Mental Health – Classification and Service Costs casemix model under the National Mental Health Information Development Funding Agreement. Analysis of data provided by all jurisdictions under this funding agreement will inform the development of national casemix benchmarks for mental health.

1.1 Inpatient Decision Tree

The following diagram represents the logic for admitted patients under the 2004/2005 Model.

Chart 1 – Admitted Patient Decision Tree

Chart 2 - Admitted Patient Decision Tree

1.5 Emergency Department Benchmarks

Emergency Department costs are not included in the acute inpatient cost benchmarks and therefore constitute a separate component.

The Emergency Department component has been expanded to include a category for Did Not Wait. The hospitals in scope for the Emergency Department component have also been revised and the new peer groupings are listed below. These peer groups have been developed in consultation with the Clinical Services Analysis Unit and Surgical Access Service.

The revised peer groups are as follows:

Level 2:

Bundaberg Hospital, Caboolture Hospital, Gladstone Hospital, Mackay Hospital, Maryborough Hospital, Mount Isa Hospital, The Prince Charles Hospital, Queen Elizabeth II Jubilee Hospital, Redland Hospital.

Level 3:

Cairns Hospital, Gold Coast Hospital, Hervey Bay Hospital, Ipswich Hospital, Logan Hospital, Mater Adult Hospital, Mater Mother's Hospital, Nambour Hospital, Redcliffe Hospital, Rockhampton Hospital, Toowoomba Hospital.

Super Specialist:

Mater Children's Hospital, Princess Alexandra Hospital, Royal Brisbane and Women's Hospital, Royal Children's Hospital, The Townsville Hospital.

The Level 2 and 3 hospitals have been combined and there is one set of benchmarks for these hospitals. The Super Specialist hospitals have their own set of benchmarks.

The cost benchmarks include radiology, pathology and pharmacy costs linked to the Emergency Department attendance.

The cost benchmarks for each group are shown below:

Table 4 - Emergency Department Cost Benchmarks by Category

Category	Level 2 and 3 Cost Benchmark (\$)	Super Specialist Cost Benchmark (\$)
Admitted/transferred triage 1	569	1109
Admitted/transferred triage 2	378	580
Admitted/transferred triage 3	296	445
Admitted/transferred triage 4	220	288
Admitted/transferred triage 5	156	196
Died	384	480
Discharged triage 1	421	520
Discharged triage 2	309	488
Discharged triage 3	238	348
Discharged triage 4	160	163
Discharged triage 5	108	129
Did Not Wait	54	65

Definitions for the Emergency Department presentations captured within this component are detailed in the *Monthly Activity Collection Manual for Public Facilities* published by Data Services Unit.

2. Other Components

2.1 Renal Dialysis Benchmarks

Inpatient haemodialysis (which groups to AR-DRG I 61Z (Admit for Renal Dialysis)) is only one of a range of dialysis services provided by Queensland Health in a range of settings. Due to the relatively small number of patients and high cost per patient, it is important to approach the provision of this service from a patient centric perspective.

The Table below lists the annualised benchmarks for each of the major renal dialysis treatment modalities.

Table 5 - Renal Dialysis Cost Benchmarks

Dialysis Modality	Cost Benchmark	Equivalent Cost Weights
Hospital Haemodialysis	\$66,420	26.57
Satellite Haemodialysis	\$56,900	22.76
Home Haemodialysis	\$46,380	18.55
Home Continuous Ambulatory Peritoneal Dialysis & Ambulatory Peritoneal Dialysis	\$52,600	21.04

The benchmarks are designed to cover the cost of maintenance dialysis for each end stage renal failure patient over a financial year.

The benchmarks exclude Australian Government-funded Highly Specialised Drugs, the creation of an AV Fistula, and capital equipment depreciation per year. In addition, the establishment of shunts, ongoing monitoring or maintenance services and treatment provided in the event of complications are not included in any of the benchmarks. These would therefore continue to be considered within the Hospital Cost Benchmarks rather than being incorporated into the Renal Dialysis Benchmarks. For example, peritoneal dialysis patients presenting to hospital outpatient departments for injections, dressings, treatment of infections, or blood and other biochemical checks would still be reported as ambulatory occasions of service.
